Date:

Qno: 3

Input:
sensors = number of sensors (row)
hours = reading per sensor (cols
temp [sensors] [hours]

Output:
Individual report per sensor:
Total, Avg, Max, Min, critical, Warning, Longest Hot.
Final: Sensor number with highest average-
Final: Sensor number with highest average-

Pseudocode:

```
Function InputData (sensors, hours, temp[][])
 for i=0 to s-1
  for j=0 to h-1
   input temp[i][j]
 End for
End for, End function.

Function Analyze sensor (hour, row[], total, avg,
                         max, min, ~~temp~~, critical, warning, streak)
total=0, critical=0, warning=0,
max=row[0], min=row[0],
currentStreak=0, streak=0
 for j=0 to h-1
   total += row[j]
if row[j] > max then max=row[j]
```

Date:

```
if row[j] < min then min = row[j]
if row[j] >= 40 then critical ++
if row[j] >= 35 AND row[j] <= 39 then
  warning ++,
if row[j] >= 35 then
  currentstreak ++
  if currentstreak >= streak then
    streak = currentstreak.
Else
   currentstreak = 0
End if, end for
  avg = total/hours
End function
function Highestavgsensor(sensors, avgarray[])
   highestinden = 0
for i = 1 to s-1
   if avgarray[i] > avgarray[highestInden] then
     highestinden = i
End if
 End for
Return highest Inden
End function-
